4.1.1 Detailed Description

DAVIS specific configuration defines and information structures.

4.1.2 Macro Definition Documentation

4.1.2.1 CAER_DEVICE_DAVIS

```
#define CAER_DEVICE_DAVIS 4
```

Device type definition for iniLabs DAVIS boards, supporting both FX2 and FX3 generation devices. This is the preferred way to access cameras now.

4.1.2.2 CAER_DEVICE_DAVIS_FX2

```
#define CAER_DEVICE_DAVIS_FX2 1
```

Device type definition for iniLabs DAVIS FX2-based boards, like DAVIS240a/b/c. Deprecated in favor of [CAER_DEVICE_DAVIS](#).

4.1.2.3 CAER_DEVICE_DAVIS_FX3

```
#define CAER_DEVICE_DAVIS_FX3 2
```

Device type definition for iniLabs DAVIS FX3-based boards, like DAVIS640. Deprecated in favor of [CAER_DEVICE_DAVIS](#).

4.1.2.4 DAVIS128_CONFIG_BIAS_ADCCOMPBP

```
#define DAVIS128_CONFIG_BIAS_ADCCOMPBP 19
```

Parameter address for module [DAVIS128_CONFIG_BIAS](#): DAVIS128 chip biases. Bias configuration values must be generated using the proper functions, which are:

- [caerBiasVDACGenerate\(\)](#) for VDAC (voltage) biases.
- [caerBiasCoarseFineGenerate\(\)](#) for coarse-fine (current) biases.
- [caerBiasShiftedSourceGenerate\(\)](#) for shifted-source biases. See '<http://inilabs.com/support/biasing/>' for more details.

4.1.2.5 DAVIS128_CONFIG_BIAS_ADCCREFHIGH

```
#define DAVIS128_CONFIG_BIAS_ADCCREFHIGH 2
```

Parameter address for module DAVIS128_CONFIG_BIAS: DAVIS128 chip biases. Bias configuration values must be generated using the proper functions, which are:

- [caerBiasVDACGenerate\(\)](#) for VDAC (voltage) biases.
- [caerBiasCoarseFineGenerate\(\)](#) for coarse-fine (current) biases.
- [caerBiasShiftedSourceGenerate\(\)](#) for shifted-source biases. See '<http://inilabs.com/support/biasing/>' for more details.

4.1.2.6 DAVIS128_CONFIG_BIAS_ADCCREFLOW

```
#define DAVIS128_CONFIG_BIAS_ADCCREFLOW 3
```

Parameter address for module DAVIS128_CONFIG_BIAS: DAVIS128 chip biases. Bias configuration values must be generated using the proper functions, which are:

- [caerBiasVDACGenerate\(\)](#) for VDAC (voltage) biases.
- [caerBiasCoarseFineGenerate\(\)](#) for coarse-fine (current) biases.
- [caerBiasShiftedSourceGenerate\(\)](#) for shifted-source biases. See '<http://inilabs.com/support/biasing/>' for more details.

4.1.2.7 DAVIS128_CONFIG_BIAS_AEPDBN

```
#define DAVIS128_CONFIG_BIAS_AEPDBN 23
```

Parameter address for module DAVIS128_CONFIG_BIAS: DAVIS128 chip biases. Bias configuration values must be generated using the proper functions, which are:

- [caerBiasVDACGenerate\(\)](#) for VDAC (voltage) biases.
- [caerBiasCoarseFineGenerate\(\)](#) for coarse-fine (current) biases.
- [caerBiasShiftedSourceGenerate\(\)](#) for shifted-source biases. See '<http://inilabs.com/support/biasing/>' for more details.

4.1.2.8 DAVIS128_CONFIG_BIAS_AEPUXBP

```

4.2.1 Detailed Description

Common functions to access, configure and exchange data with supported devices. Also contains defines for host related configuration options.

4.2.2 Macro Definition Documentation

4.2.2.1 CAER_HOST_CONFIG_DATAEXCHANGE

```
#define CAER_HOST_CONFIG_DATAEXCHANGE -2
```

Module address: host-side data exchange (ring-buffer) configuration.

4.2.2.2 CAER_HOST_CONFIG_DATAEXCHANGE_BLOCKING

```
#define CAER_HOST_CONFIG_DATAEXCHANGE_BLOCKING 1
```

Parameter address for module CAER_HOST_CONFIG_DATAEXCHANGE: when calling [caerDeviceDataGet\(\)](#), the function can either be blocking, meaning it waits until it has a valid EventPacketContainer to return, or not, meaning it returns right away. This behavior can be set with this flag. Please see the [caerDeviceDataGet\(\)](#) documentation for more information on its return values.

4.2.2.3 CAER_HOST_CONFIG_DATAEXCHANGE_BUFFER_SIZE

```
#define CAER_HOST_CONFIG_DATAEXCHANGE_BUFFER_SIZE 0
```

Parameter address for module CAER_HOST_CONFIG_DATAEXCHANGE: set size of elements that can be held by the thread-safe FIFO buffer between the data transfer thread and the main thread. The default values are usually fine, only change them if you're running into lots of dropped/missing packets; you can turn on the INFO log level to see when this is the case.

4.2.2.4 CAER_HOST_CONFIG_DATAEXCHANGE_START_PRODUCERS

```
#define CAER_HOST_CONFIG_DATAEXCHANGE_START_PRODUCERS 2
```

Parameter address for module CAER_HOST_CONFIG_DATAEXCHANGE: whether to start all the data producer modules on the device (DVS, APS, Mux, ...) automatically when starting the data transfer thread with [caerDeviceDataStart\(\)](#) or not. If disabled, be aware you will have to start the right modules manually, which can be useful if you need precise control over which ones are running at any time.

4.2.2.5 CAER_HOST_CONFIG_DATAEXCHANGE_STOP_PRODUCERS

```
#define CAER_HOST_CONFIG_DATAEXCHANGE_STOP_PRODUCERS 3
```

Parameter address for module CAER_HOST_CONFIG_DATAEXCHANGE: whether to stop all the data producer modules on the device (DVS, APS, Mux, ...) automatically when stopping the data transfer thread with [caerDeviceDataStop\(\)](#) or not. If disabled, be aware you will have to stop the right modules manually, to halt the data flow, which can be useful if you need precise control over which ones are running at any time.

4.2.2.6 CAER_HOST_CONFIG_LOG

```
#define CAER_HOST_CONFIG_LOG -4
```

Module address: host-side logging configuration.

4.2.2.7 CAER_HOST_CONFIG_LOG_LEVEL

```
#define CAER_HOST_CONFIG_LOG_LEVEL 0
```

Parameter address for module CAER_HOST_CONFIG_LOG: set the log-level for this device, to be used when logging messages. Defaults to the value of the global log-level when the device was first opened.

4.2.2.8 CAER_HOST_CONFIG_PACKETS

```
#define CAER_HOST_CONFIG_PACKETS -3
```

Module address: host-side event packets generation configuration.

4.2.2.9 CAER_HOST_CONFIG_PACKETS_MAX_CONTAINER_INTERVAL

```
#define CAER_HOST_CONFIG_PACKETS_MAX_CONTAINER_INTERVAL 1
```

Parameter address for module CAER_HOST_CONFIG_PACKETS: set the time interval between subsequent packet containers. The value is in microseconds, and is checked across all types of events contained in the Event↵PacketContainer.

4.2.2.10 CAER_HOST_CONFIG_PACKETS_MAX_CONTAINER_PACKET_SIZE

```
#define CAER_HOST_CONFIG_PACKETS_MAX_CONTAINER_PACKET_SIZE 0
```

Parameter address for module CAER_HOST_CONFIG_PACKETS: set the maximum number of events any of a packet container's packets may hold before it's made available to the user. This is checked for each number of events held in each typed EventPacket that is a part of the EventPacketContainer.

4.2.3 Typedef Documentation

4.2.3.1 caerDeviceHandle

```
typedef struct caer_device_handle* caerDeviceHandle
```

Pointer to an open device on which to operate.

4.2.4 Function Documentation

4.2.4.1 caerDeviceClose()

```
bool caerDeviceClose (
    caerDeviceHandle * handle )
```

Close a previously opened device and invalidate its handle.

Parameters

<i>handle</i>	pointer to a valid device handle. Will set handle to NULL if closing is successful, to prevent further usage of this handle for other operations.
---------------	---

Returns

true if closing was successful, false on errors.

4.2.4.2 caerDeviceConfigGet()

```
bool caerDeviceConfigGet (
    caerDeviceHandle handle,
    int8_t modAddr,
    uint8_t paramAddr,
    uint32_t * param )
```

Get the value of a configuration parameter.

Parameters

<i>handle</i>	a valid device handle.
<i>modAddr</i>	a module address, used to specify which configuration module one wants to query. Negative addresses are used for host-side configuration, while positive addresses (including zero) are used for device-side configuration.
<i>paramAddr</i>	a parameter address, to select a specific parameter to query from this particular configuration module. Only positive numbers (including zero) are allowed.
<i>param</i>	a pointer to an integer, in which to store the configuration parameter's current value. The integer will always be either set to zero (on failure), or to the current value (on success).

Returns

true if getting the configuration was successful, false on errors.

4.2.4.3 caerDeviceConfigSet()

```
bool caerDeviceConfigSet (
    caerDeviceHandle handle,
    int8_t modAddr,
    uint8_t paramAddr,
    uint32_t param )
```

Set a configuration parameter to a given value.

Parameters

<i>handle</i>	a valid device handle.
<i>modAddr</i>	a module address, used to specify which configuration module one wants to update. Negative addresses are used for host-side configuration, while positive addresses (including zero) are used for device-side configuration.
<i>paramAddr</i>	a parameter address, to select a specific parameter to update from this particular configuration module. Only positive numbers (including zero) are allowed.
<i>param</i>	a configuration parameter's new value.

Returns

true if sending the configuration was successful, false on errors.

4.2.4.4 caerDeviceDataGet()

```
caerEventPacketContainer caerDeviceDataGet (
    caerDeviceHandle handle )
```

Get an event packet container, which contains events of various types generated by the device, for further processing. The returned data structures are allocated in memory and will need to be freed. The [caerEventPacketContainerFree\(\)](#) function can be used to correctly free the full container memory. For single caerEventPackets, just use free(). This function can be made blocking with the CAER_HOST_CONFIG_DATAEXCHANGE_BLOCKING configuration parameter. By default it is non-blocking.

Parameters

<i>handle</i>	a valid device handle.
---------------	------------------------

Returns

a valid event packet container. NULL will be returned on errors, or when there is no container available in non-blocking mode. Always check for this!

4.2.4.5 caerDeviceDataStart()

```
bool caerDeviceDataStart (
    caerDeviceHandle handle,
    void(*) (void *ptr) dataNotifyIncrease,
    void(*) (void *ptr) dataNotifyDecrease,
    void * dataNotifyUserPtr,
    void(*) (void *ptr) dataShutdownNotify,
    void * dataShutdownUserPtr )
```

Start getting data from the device, setting up the data transfers and starting the data producers (see [CAER_HOST_CONFIG_DATAEXCHANGE_START_PRODUCERS](#)). Supports notification of new data and exceptional shutdown events via user-defined call-backs.

Parameters

<i>handle</i>	a valid device handle.
<i>dataNotifyIncrease</i>	function pointer, called every time a new piece of data available and has been put in the FIFO buffer for consumption. <code>dataNotifyUserPtr</code> will be passed as parameter to the function.
<i>dataNotifyDecrease</i>	function pointer, called every time a new piece of data has been consumed from the FIFO buffer inside <code>caerDeviceDataGet()</code> . <code>dataNotifyUserPtr</code> will be passed as parameter to the function.
<i>dataNotifyUserPtr</i>	pointer that will be passed to the <code>dataNotifyIncrease</code> and <code>dataNotifyDecrease</code> functions. Can be NULL.
<i>dataShutdownNotify</i>	function pointer, called on exceptional shut-down of the data transfers. This is used to detect exceptional shut-downs that do not come from calling <code>caerDeviceDataStop()</code> , such as when the device is disconnected or all data transfers fail.
<i>dataShutdownUserPtr</i>	pointer that will be passed to the <code>dataShutdownNotify</code> function. Can be NULL.

Returns

true if starting the data transfer was successful, false on errors.

4.2.4.6 caerDeviceDataStop()

```
bool caerDeviceDataStop (
    caerDeviceHandle handle )
```

Stop getting data from the device, shutting down the data transfers and stopping the data producers (see `CAER_HOST_CONFIG_DATAEXCHANGE_STOP_PRODUCERS`). This normal shut-down will not generate a notification (see `caerDeviceDataStart()`).

Parameters

<i>handle</i>	a valid device handle.
---------------	------------------------

Returns

true if stopping the data transfer was successful, false on errors.

4.2.4.7 caerDeviceSendDefaultConfig()

```
bool caerDeviceSendDefaultConfig (
    caerDeviceHandle handle )
```

Send a set of good default configuration settings to the device. This avoids users having to set every configuration option each time, especially when wanting to get going quickly or just needing to change a few settings to get to the desired operating mode.

Parameters

<i>handle</i>	a valid device handle.
---------------	------------------------

Returns

true if sending the configuration was successful, false on errors.

4.4.1 Detailed Description

Dynap-se specific configuration defines and information structures.

4.4.2 Macro Definition Documentation

4.4.2.1 CAER_DEVICE_DYNAPSE

```
#define CAER_DEVICE_DYNAPSE 3
```

Device type definition for iniLabs Dynap-se FX2-based boards.

4.4.2.2 DYNAPSE_CHIP_DYNAPSE

```
#define DYNAPSE_CHIP_DYNAPSE 64
```

Dynap-se chip identifier.

4.4.2.3 DYNAPSE_CONFIG_AER

```
#define DYNAPSE_CONFIG_AER 1
```

Module address: device-side AER configuration (from chip). The AER state machine handshakes with the chip's AER bus and gets the spike events from it. It supports various configurable delays.

4.4.2.4 DYNAPSE_CONFIG_AER_ACK_DELAY

```
#define DYNAPSE_CONFIG_AER_ACK_DELAY 4
```

Parameter address for module DYNAPSE_CONFIG_AER: delay capturing the data and acknowledging it on the AER bus for the events by this many LogicClock cycles.

4.4.2.5 DYNAPSE_CONFIG_AER_ACK_EXTENSION

```
#define DYNAPSE_CONFIG_AER_ACK_EXTENSION 6

4.4.2.6 DYNAPSE_CONFIG_AER_EXTERNAL_AER_CONTROL

```
#define DYNAPSE_CONFIG_AER_EXTERNAL_AER_CONTROL 10
```

Parameter address for module DYNAPSE_CONFIG_AER: enable external AER control. This ensures the chip and the neuron array are running, but doesn't do the handshake and leaves the ACK pin in high-impedance, to allow for an external system to take over the AER communication with the chip. DYNAPSE_CONFIG_AER_RUN has to be turned off for this to work.

4.4.2.7 DYNAPSE_CONFIG_AER_RUN

```
#define DYNAPSE_CONFIG_AER_RUN 3
```

Parameter address for module DYNAPSE_CONFIG_AER: run the AER state machine and get spike events from the chip by handshaking with its AER bus.

4.4.2.8 DYNAPSE_CONFIG_AER_WAIT_ON_TRANSFER_STALL

```
#define DYNAPSE_CONFIG_AER_WAIT_ON_TRANSFER_STALL 8
```

Parameter address for module DYNAPSE_CONFIG_AER: if the output FIFO for this module is full, stall the AER handshake with the chip and wait until it's free again, instead of just continuing the handshake and dropping the resulting events.

4.4.2.9 DYNAPSE_CONFIG_BIAS_C0_PULSE_PWLK_P

```
#define DYNAPSE_CONFIG_BIAS_C0_PULSE_PWLK_P 0

```

Value:

```
for (int32_t caerIteratorCounter = 0; \
    caerIteratorCounter < caerEventPacketHeaderGetEventNumber(
    PACKET_HEADER); \
    caerIteratorCounter++) { \
    EVENT_TYPE caerIteratorElement = (EVENT_TYPE) caerGenericEventGetEvent(
    PACKET_HEADER, caerIteratorCounter); \
    if (!caerGenericEventIsValid(caerIteratorElement)) { continue; }
```

Generic iterator over only the valid events in a packet. Returns the current index in the 'caerIteratorCounter' variable of type 'int32_t' and the current event in the 'caerIteratorElement' variable of type EVENT_TYPE.

PACKET_HEADER: a valid EventPacket header pointer. Cannot be NULL. EVENT_TYPE: the event pointer type for this EventPacket (ie. caerPolarityEvent or caerFrameEvent).

4.8.2.7 TS_OVERFLOW_SHIFT

```
#define TS_OVERFLOW_SHIFT 31
```

64bit timestamp support: since timestamps wrap around after some time, being only 31 bit (32 bit signed int), another timestamp at the packet level provides another 31 bit (32 bit signed int), to enable the generation of a 62 bit (64 bit signed int) microsecond timestamp which is guaranteed to never wrap around (in the next 146'138 years at least). The TSOverflow needs to be shifted by 31 thus when constructing such a timestamp.

4.8.2.8 VALID_MARK_MASK

```
#define VALID_MARK_MASK 0x00000001
```

Generic validity mark: this bit is used to mark whether an event is still valid or not, and can be used to efficiently filter out events from a packet. The caerXXXEventValidate() and caerXXXEventInvalidate() functions should be used to toggle this! 0 in the 0th bit of the first byte means invalid, 1 means valid. This way zeroing-out an event packet sets all its events to invalid. Care must be taken to put the field containing the validity mark always as the first member of an event.

4.8.2.9 VALID_MARK_SHIFT

```
#define VALID_MARK_SHIFT 0
```

Generic validity mark: this bit is used to mark whether an event is still valid or not, and can be used to efficiently filter out events from a packet. The caerXXXEventValidate() and caerXXXEventInvalidate() functions should be used to toggle this! 0 in the 0th bit of the first byte means invalid, 1 means valid. This way zeroing-out an event packet sets all its events to invalid. Care must be taken to put the field containing the validity mark always as the first member of an event.

4.8.5.1 caerEventPacketAppend()

```
static caerEventPacketHeader caerEventPacketAppend (
    caerEventPacketHeader packet,
    caerEventPacketHeader appendPacket ) [inline], [static]

<i>eventType</i>	the numerical event type (see 'enum caer_default_event_types').

4.8.5.26 caerEventPacketHeaderSetEventValid()

```

```
static caerEventPacketHeader caerEventPacketResize (
    caerEventPacketHeader packet,
    int32_t newEventCapacity ) [inline], [static]
```

Resize an event packet. First, the packet is cleaned (all invalid events removed), then:

- If the old and new event capacity are equal, nothing else changes.
- If the new capacity is bigger, the packet is enlarged and the new events are initialized to all zeros (invalid).
- If the new capacity is smaller, the packet is truncated at the given point. Use free() to reclaim this memory afterwards.

Parameters

<i>packet</i>	the current event packet.
<i>newEventCapacity</i>	the new maximum number of events this packet can hold. Cannot be zero.

Returns

a valid event packet handle or NULL on error. On success, the old packet handle is to be considered invalid and not to be used anymore. On failure, the old packet handle is still valid, but will have been cleaned of all invalid events!

4.8.5.28 caerGenericEventGetEvent()

```
static const void* caerGenericEventGetEvent (
    caerEventPacketHeaderConst headerPtr,
    int32_t n ) [inline], [static]
```

Parameters

<i>headerPtr</i>	a valid EventPacket header pointer. Cannot be NULL.
<i>n</i>	the index of the returned event. Must be within [0,eventNumber[bounds.

Returns

a generic pointer to the requested event. NULL on error. This points to unmodifiable memory, as it should never be used for anything other than read operations, such as [caerGenericEventGetTimestamp\(\)](#). Don't modify the memory, you have no idea what it is! If you do know, just use the proper typed packet functions.

4.8.5.29 caerGenericEventGetTimestamp()

<i>headerPtr</i>	a valid EventPacket header pointer. Cannot be NULL.

Returns

the main 32 bit timestamp of this event.

4.8.5.30 caerGenericEventGetTimestamp64()

```
static int64_t caerGenericEventGetTimestamp64 (
    const void * eventPtr,
    caerEventPacketHeaderConst headerPtr ) [inline], [static]
```

Get the main 64 bit timestamp for a generic event, without having to know what event type the packet is containing. This takes the per-packet timestamp into account too, generating a timestamp that doesn't suffer from overflow problems.

Parameters

<i>eventPtr</i>	a generic pointer to an event. Cannot be NULL.
<i>headerPtr</i>	a valid EventPacket header pointer. Cannot be NULL.

Returns

the main 64 bit timestamp of this event.

4.8.5.31 caerGenericEventIsValid()

```
static bool caerGenericEventIsValid (
    const void * eventPtr ) [inline], [static]
```

Check if the given generic event is valid or not.

Parameters

<i>eventPtr</i>	a generic pointer to an event. Cannot be NULL.
-----------------	--

Returns

true if the event is valid, false otherwise.

4.8.5.32 PACKED_STRUCT()

```
PACKED_STRUCT (
    struct caer_event_packet_header { int16_t eventType;int16_t eventSource;int32_t
eventSize;int32_t eventTSOffset;int32_t eventTSOverflow;int32_t eventCapacity;int32_t event↵
Number;int32_t eventValid;} )
```

EventPacket header data structure definition. The size, also defined in CAER_EVENT_PACKET_HEADER_SIZE, must always be constant. The header is common to all types of event packets and is always the very first member of an event packet data structure. Signed integers are used for compatibility with languages that do not have unsigned ones, such as Java.

4.9.1 Detailed Description

Configuration Events format definition and handling functions. This event contains information about the current configuration of the device. By having configuration as a standardized event format, it becomes host-software agnostic, and it also becomes part of the event stream, enabling easy tracking of changes through time, by putting them into the event stream at the moment they happen. While the resolution of the timestamps for these events is in microseconds for compatibility with all other event types, the precision is in the order of ~1-20 milliseconds, given that these events are generated and injected on the host-side.

4.10.3 Typedef Documentation

4.10.3.1 caerEarEvent

```
typedef struct caer_ear_event* caerEarEvent
```

Type for pointer to ear (cochlea) event data structure.

4.10.4 Function Documentation

4.10.4.1 caerEarEventGetChannel()

```
static uint16_t caerEarEventGetChannel (
    caerEarEventConst event ) [inline], [static]
```

Get the channel (frequency band) ID. The channels count from 0 upward, where 0 is the highest frequency channel, while higher numbers are progressively lower frequency channels. This is derived from how the actual human ear works.

Parameters

<i>event</i>	a valid EarEvent pointer. Cannot be NULL.

    int32_t n ) [inline], [static]
```

Get the ear (cochlea) event at the given index from the event packet. This is a read-only event, do not change its contents in any way!

4.10.4.14 PACKED_STRUCT() [1/2]

```
PACKED_STRUCT (
    struct caer_ear_event { uint32_t data;int32_t timestamp;} )
```

Ear (cochlea) event data structure definition. Contains information on events gotten from a cochlea chip: ears, channels, neurons and filters are stored. Signed integers are used for fields that are to be interpreted directly, for compatibility with languages that do not have unsigned integer types, such as Java.

4.10.4.15 PACKED_STRUCT() [2/2]

```
PACKED_STRUCT (
    struct caer_ear_event_packet { struct caer_event_packet_header packetHeader;struct
    caer_ear_event events[];} )
```

Ear (cochlea) event packet data structure definition. EventPackets are always made up of the common packet header, followed by 'eventCapacity' events. Everything has to be in one contiguous memory block.

4.11.1 Detailed Description

Frame Events format definition and handling functions. This event type encodes intensity frames, like you would get from a normal APS camera. It supports multiple channels for color, color filter information, as well as multiple Regions of Interest (ROI). The (0, 0) pixel is in the upper left corner of the screen, like in OpenCV/computer graphics. The pixel array is laid out row by row (increasing X axis), going from top to bottom (increasing Y axis).

```

PACKED_STRUCT (
    struct caer_frame_event { uint32_t info;int32_t ts_startframe;int32_t ts_endframe;int32↵
    _t ts_startexposure;int32_t ts_endexposure;int32_t lengthX;int32_t lengthY;int32_t positionX;int32↵
    _t positionY;uint16_t pixels[1];} )

```

Frame event data structure definition. This contains the actual information on the frame (ROI, color channels, color filter), several timestamps to signal start and end of capture and of exposure, as well as the actual pixels, in a 16 bit normalized format. The (0, 0) address is in the upper left corner, like in OpenCV/computer graphics. The pixel array is laid out row by row (increasing X axis), going from top to bottom (increasing Y axis). Signed integers are used for fields that are to be interpreted directly, for compatibility with languages that do not have unsigned integer types, such as Java.

4.11.5.49 PACKED_STRUCT() [2/2]

```

PACKED_STRUCT (
    struct caer_frame_event_packet { struct caer_event_packet_header packetHeader;}
)

```

Frame event packet data structure definition. EventPackets are always made up of the common packet header, followed by 'eventCapacity' events. Everything has to be in one contiguous memory block. Direct access to the events array is not possible for Frame events. To calculate position offsets, use the 'eventSize' field in the packet header.

X increases to the right, Y going up and Z towards where the lens is pointing. Rotation for the gyroscope is counter-clockwise along the increasing axis, for all three axes. Floats are in IEEE 754-2008 binary32 format. Signed integers are used for fields that are to be interpreted directly, for compatibility with languages that do not have unsigned integer types, such as Java.

IMU 9-axes event data structure definition. This contains accelerometer and gyroscope headings, plus temperature, and magnetometer readings. The X, Y and Z axes are referred to the camera plane. X increases to the right, Y going up and Z towards where the lens is pointing. Rotation for the gyroscope is counter-clockwise along the increasing axis, for all three axes. Floats are in IEEE 754-2008 binary32 format. Signed integers are used for fields that are to be interpreted directly, for compatibility with languages that do not have unsigned integer types, such as Java.

4.14.1 Detailed Description

EventPacketContainer format definition and handling functions. An EventPacketContainer is a logical construct that contains packets of events (EventPackets) of different event types, with the aim of keeping related events of differing types, such as DVS and IMU data, together. Such a relation is usually based on time intervals, trying to keep groups of event happening in a certain time-slice together. This time-order is based on the *main* time-stamp of an event, the one whose offset is referenced in the event packet header and that is used by the caerGenericEvent*() functions. It's guaranteed that all conforming input modules keep to this rule, generating containers that include all events from all types within the given time-slice. The smallest and largest timestamps are tracked at the packet container level as a convenience, to avoid having to examine all packets for this often useful piece of information. All integers are in their native host format, as this is a purely internal, in-memory data structure, never meant for exchange between different systems (and different endianness).

== Packet Containers and Input Modules == The "packeting system" works in this way: events are accumulated by type in a packet, and that packet is part of a packet container, by an input module. The packet container is then sent out for processing when either the configured time limit or the size limit are hit. The time limit is always active, in microseconds, and basically tells you the time-span an event packet covers. This enables regular, constant delivery of packets, that cover a period of time. The size limit is an add-on to prevent packets to grow to immense sizes (like if the time limit is high and there is lots of activity). As soon as a packet hits the number of events in the size limit, it is sent out. The regular time limit is not reset in this case. This size limit can be disabled by setting it to 0. The cAER DVS128/DAVIS/File/Network input modules call these two configuration variables "PacketContainerInterval" and "PacketContainerMaxPacketSize". Too small packet sizes or intervals simply mean more packets, which may negatively affect performance. It's usually a good idea to set the size to something around 4-8K, and the time to a good value based on the application you're building, so if you need ms-reaction-time, you probably want to set it to 1000µs, so that you do get new data every ms. If on the other hand you're looking at a static scene and just want to detect that something is passing by once every while, a higher number like 100ms might also be perfectly appropriate.

The one measurement (x) is stored as a float. Floats are in IEEE 754-2008 binary32 format. Signed integers are used for fields that are to be interpreted directly, for compatibility with languages that do not have unsigned integer types, such as Java.

4.15.4.17 PACKED_STRUCT() [2/2]

```
PACKED_STRUCT (
    struct caer_point1d_event_packet { struct caer_event_packet_header packetHeader;struct
    caer_point1d_event events[];} )
```

Point1D event packet data structure definition. EventPackets are always made up of the common packet header, followed by 'eventCapacity' events. Everything has to be in one contiguous memory block.

```

Get the measurement scale. This allows order of magnitude shifts on the measured value to be applied automatically, such as having measurements of type Distance (meters) and storing the values as centimeters (10^{-2}) for higher precision, but keeping that information around to allow easy changes of unit.

Parameters

<i>event</i>	a valid Point2DEvent pointer. Cannot be NULL.

The two measurements (x, y) are stored as floats. Floats are in IEEE 754-2008 binary32 format. Signed integers are used for fields that are to be interpreted directly, for compatibility with languages that do not have unsigned integer types, such as Java.

4.16.4.19 PACKED_STRUCT() [2/2]

```
PACKED_STRUCT (
    struct caer_point2d_event_packet { struct caer_event_packet_header packetHeader;struct
    caer_point2d_event events[];} )
```

Point2D event packet data structure definition. EventPackets are always made up of the common packet header, followed by 'eventCapacity' events. Everything has to be in one contiguous memory block.

)
```

Point3D event data structure definition. This contains information about the measurement, such as a type and a scale field, together with the usual validity mark. The three measurements (x, y, z) are stored as floats. Floats are in IEEE 754-2008 binary32 format. Signed integers are used for fields that are to be interpreted directly, for compatibility with languages that do not have unsigned integer types, such as Java.

4.17.4.21 PACKED_STRUCT() [2/2]

```
PACKED_STRUCT (
    struct caer_point3d_event_packet { struct caer_event_packet_header packetHeader;struct
    caer_point3d_event events[];} )
```

Point3D event packet data structure definition. EventPackets are always made up of the common packet header, followed by 'eventCapacity' events. Everything has to be in one contiguous memory block.

```

Set the measurement scale. This allows order of magnitude shifts on the measured value to be applied automatically, such as having measurements of type Distance (meters) and storing the values as centimeters (10^{-2}) for higher precision, but keeping that information around to allow easy changes of unit.

Parameters

<i>event</i>	a valid Point4DEvent pointer. Cannot be NULL.
<i>scale</i>	the Point4D measurement scale.

4.18.4.15 caerPoint4DEventSetTimestamp()

```
static void caerPoint4DEventSetTimestamp (
    caerPoint4DEvent event,
    int32_t timestamp ) [inline], [static]
```

Set the 32bit event timestamp, the value has to be in microseconds.

Parameters

<i>event</i>	a valid Point4DEvent pointer. Cannot be NULL.
<i>timestamp</i>	a positive 32bit microsecond timestamp.

4.18.4.16 caerPoint4DEventSetType()

```
static void caerPoint4DEventSetType (
```

```
    caerPoint4DEvent event,  
    uint8_t type ) [inline], [static]
```

Set the measurement event type. This is useful to distinguish between different measurements, for example distance or weight.

Parameters

<i>event</i>	a valid Point4DEvent pointer. Cannot be NULL.
<i>type</i>	the Point4D measurement type.

4.18.4.17 caerPoint4DEventSetW()

    caerPoint4DEvent event,
    caerPoint4DEventPacket packet ) [inline], [static]
```

Validate the current event by setting its valid bit to true and increasing the event packet's event count and valid event count. Only works on events that are invalid. DO NOT CALL THIS AFTER HAVING PREVIOUSLY ALREADY INVALIDATED THIS EVENT, the total count will be incorrect.

Parameters

<i>event</i>	a valid Point4DEvent pointer. Cannot be NULL.
<i>packet</i>	the Point4DEventPacket pointer for the packet containing this event. Cannot be NULL.

4.18.4.22 PACKED_STRUCT() [1/2]

```
PACKED_STRUCT (
    struct caer_point4d_event { uint32_t info;float x;float y;float z;float w;int32_t
timestamp;} )
```

Point4D event data structure definition. This contains information about the measurement, such as a type and a scale field, together with the usual validity mark. The four measurements (x, y, z, w) are stored as floats. Floats are in IEEE 754-2008 binary32 format. Signed integers are used for fields that are to be interpreted directly, for compatibility with languages that do not have unsigned integer types, such as Java.

4.18.4.23 PACKED_STRUCT() [2/2]

```
PACKED_STRUCT (
    struct caer_point4d_event_packet { struct caer_event_packet_header packetHeader; struct
    caer_point4d_event events[]; } )
```

Point4D event packet data structure definition. EventPackets are always made up of the common packet header, followed by 'eventCapacity' events. Everything has to be in one contiguous memory block.

4.20.4.1 caerSampleEventGetSample()

```
static uint32_t caerSampleEventGetSample (

the ADC sample value.

4.20.4.2 caerSampleEventGetTimestamp()

```
static int32_t caerSampleEventGetTimestamp (
    caerSampleEventConst event ) [inline], [static]
```

Get the 32bit event timestamp, in microseconds. Be aware that this wraps around! You can either ignore this fact, or handle the special 'TIMESTAMP_WRAP' event that is generated when this happens, or use the 64bit timestamp which never wraps around. See '[caerEventPacketHeaderGetEventTSOverflow\(\)](#)' documentation for more details on the 64bit timestamp.

Parameters

<i>event</i>	a valid SampleEvent pointer. Cannot be NULL.
--------------	--

Returns

this event's 32bit microsecond timestamp.

```

Get the 64bit event timestamp, in microseconds. See '[caerEventPacketHeaderGetEventTSOverflow\(\)](#)' documentation for more details on the 64bit timestamp.

Parameters

<i>event</i>	a valid SampleEvent pointer. Cannot be NULL.
<i>packet</i>	the SampleEventPacket pointer for the packet containing this event. Cannot be NULL.

the ADC sample type.

4.20.4.5 caerSampleEventInvalidate()

```
static void caerSampleEventInvalidate (  
    caerSampleEvent event,  
    caerSampleEventPacket packet ) [inline], [static]

Parameters

<i>event</i>	a valid SampleEvent pointer. Cannot be NULL.
<i>packet</i>	the SampleEventPacket pointer for the packet containing this event. Cannot be NULL.

4.20.4.6 caerSampleEventIsValid()

Main libcaer header; provides inclusions for common system functions and definitions for useful macros used often in the code. Also includes the logging functions and definitions and several useful static inline functions for string comparison and byte array manipulation. When including libcaer, please make sure to always use the full path, ie. `#include <libcaer/libcaer.h>` and not just `#include <libcaer.h>`.

4.25.1 Detailed Description

Logging functions to print useful messages for the user.

4.25.2 Enumeration Type Documentation

4.25.2.1 caer_log_level

```
enum caer_log_level
```

Log levels for `caerLog()` logging function. Log messages only get printed if their log level is equal or above the global system log level, which can be set with `caerLogLevelSet()`. The default log level is `CAER_LOG_ERROR`. `CAER_LOG_EMERGENCY` is the most urgent log level and will always be printed, while `CAER_LOG_DEBUG` is the least urgent log level and will only be delivered if configured by the user.

4.25.3 Function Documentation

4.25.3.1 caerLog()

```
void caerLog (
    enum caer_log_level logLevel,
    const char * subSystem,
    const char * format,
    ... )
```

Main logging function. This function takes messages, formats them and sends them out to a file descriptor, respecting the system-wide log level setting and prepending the current time, the log level and a user-specified common string to the actual formatted output. The format is specified exactly as with the `printf()` family of functions. Please see their manual-page for more information.

Parameters

<i>logLevel</i>	the message-specific log level.
<i>subSystem</i>	a common, user-specified string to prepend before the message.
<i>format</i>	the message format string (see <code>printf()</code>).
...	the parameters to be formatted according to the format string (see <code>printf()</code>).

4.25.3.2 caerLogFileDescriptorsGetFirst()

```
int caerLogFileDescriptorsGetFirst (
    void )
```

Get the current output file descriptor 1.

Returns

the current output file descriptor 1.

4.25.3.3 caerLogFileDescriptorsGetSecond()

```
int caerLogFileDescriptorsGetSecond (
    void )
```

Get the current output file descriptor 2.

Returns

the current output file descriptor 2.

4.25.3.4 caerLogFileDescriptorsSet()

```
void caerLogFileDescriptorsSet (
    int fd1,
    int fd2 )
```

Set to which file descriptors log messages are sent. Up to two different file descriptors can be configured here. By default logging to STDERR only is enabled. If both file descriptors are identical, logging to it will only happen once, as if the second one was disabled.

Parameters

<i>fd1</i>	first file descriptor to log to. A negative value will disable it.
<i>fd2</i>	second file descriptor to log to. A negative value will disable it.

4.25.3.5 caerLogLevelGet()

```
enum caer_log_level caerLogLevelGet (
    void )
```

Get the current system-wide log level. Log messages are only printed if their level is equal or above this level.

Returns

the current system-wide log level.

4.25.3.6 caerLogLevelSet()

```
void caerLogLevelSet (
    enum caer_log_level logLevel )
```

Set the system-wide log level. Log messages will only be printed if their level is equal or above this level.

Parameters

<i>logLevel</i>	the system-wide log level.
-----------------	----------------------------

4.25.3.7 caerLogVA()

```
void caerLogVA (
    enum caer_log_level logLevel,
    const char * subSystem,
    const char * format,
    va_list args )
```

Secondary logging function. This function takes messages, formats them and sends them out to a file descriptor, respecting the system-wide log level setting and prepending the current time, the log level and a user-specified common string to the actual formatted output. The format is specified exactly as with the printf() family of functions. The argument list is a va_list as returned by va_start(), following the vprintf() family of functions in its functionality. Please see their manual-page for more information.

Parameters

<i>logLevel</i>	the message-specific log level.
<i>subSystem</i>	a common, user-specified string to prepend before the message.
<i>format</i>	the message format string (see printf()).
<i>args</i>	the parameters to be formatted according to the format string (see printf()). This is an argument list as returned by va_start().

4.25.3.8 caerLogVAFull()

```
void caerLogVAFull (
    int logFileDescriptor1,
    int logFileDescriptor2,
    uint8_t systemLogLevel,
    enum caer_log_level logLevel,
    const char * subSystem,
    const char * format,
    va_list args )
```

Tertiary logging function. This function takes messages, formats them and sends them out to up to two file descriptors, fully specified by the user; allows a user-given system log level setting to also be specified, and then prepends

the current time, the message log level and a user-specified common string to the actual formatted output. The format is specified exactly as with the `printf()` family of functions. The argument list is a `va_list` as returned by `va_start()`, following the `vprintf()` family of functions in its functionality. Please see their manual-page for more information.

Parameters

<i>logFileDescriptor1</i>	first output file descriptor.
<i>logFileDescriptor2</i>	second output file descriptor.
<i>systemLogLevel</i>	the system-wide log level.
<i>logLevel</i>	the message-specific log level.
<i>subSystem</i>	a common, user-specified string to prepend before the message.
<i>format</i>	the message format string (see printf()).
<i>args</i>	the parameters to be formatted according to the format string (see printf()). This is an argument list as returned by va_start().
